Request chaining.
Inside then use cy.request.

```
36                    expect(res.body.data).has.property('gender',payload.gender)
37                }).then((res) =>{
38                    const userId = res.body.data.id
39                    cy.log("user id is: " + userId)
40                    //2. get user
41                    cy.request({
42                        method: 'GET',
43                        url: 'https://gorest.co.in/public/v1/users/'+userId,
44                        headers: {
45                            'Authorization': 'Bearer ' + accessToken
46                        }
```

Assert after request chaining.

```
47                    }
48
49                }).then((res)=>{                          I
50                    expect(res.status).to.eq(200)
51                    expect(res.body.data).has.property('id', userId)
52                    expect(res.body.data).has.property('name',payload.name)
53                    expect(res.body.data).has.property('status',payload.status)
54                    expect(res.body.data).has.property('email', testEmail)
55
56            })
```

No need of separate it block though we can write.
Inside **then** itself start second request and then apply another **then** for the **get.**
